Source: 2017 PWC Employee Financial Wellness Survey

PWC's Employee Financial Wellness Survey tracks the financial and retirement well-being of working U.S. adults nationwide. This year it incorporates the views of over 1,600 full-time employed adults representative of the U.S. population by age and gender. The margin of error is +/- 3%. Survey participants are these ages in 2017: 21 to 35 (Millennials*), 36 to 56 (Gen X) and 57 to 74 (Baby Boomers).

Initial investment in variable annuity

Accumulates tax-deferred for **10 years** at **3%** net growth rate for a total of **\$201,587.46**

Guaranteed Lifetime Withdrawal Benefit (GLWB) of **5%**

\$10,079.37

Annual payout when client turns on income payments

Age 55

Age 60

Age 65

Variable annuities are long-term investment vehicles designed for retirement purposes. They contain underlying investment portfolios that are subject to investment risk, including possible loss of principal. Like most investments, variable annuities include certain fees and expenses, such as administrative fees, sales charges, and mortality risk expense charges. Withdrawing taxable amounts are subject to ordinary income tax and if made before age 59½, it may be subject to a 10% IRS penalty. Withdrawals may reduce the benefits and contract value and may be subject to withdrawal charges. Annuity benefits and features vary, so you should carefully consider if the products is right for you. Some benefits may incur additional costs. Any guarantee associated with an annuity is subject to the claims-paying ability of the issuing life insurance company.

T. Rowe Price does not offer variable annuities. Call or visit your financial professional to request a variable annuity prospectus that includes investment objectives, risks, fees, expenses, and other information that you should read and consider carefully before investing. Information in this piece does not pertain to any T. Rowe Price product and is not a solicitation for any product.

This chart is for illustrative purposes only and is not intended to represent the performance of any specific investment. Results are shown gross of applicable annuity fees and expenses and would have been lower if such fees and expenses had been deducted. This illustration does not reflect taxes that may be due at the end of the investment period or after an early withdrawal. There are risks associated with investing, including the risk of loss not reflected in this illustration.

Lower maximum tax rates on capital gains and dividends would make the investment return for the taxable investment more favorable, thereby reducing the difference in performance between the accounts shown. Changes in tax rates and the tax treatment of investment earnings may impact comparative results. You should consider your personal investment horizon and income tax brackets, both current and anticipated, when making an investment decision since these factors may further impact the results of the comparison.
