

# Methodology summary: Target date strategies study

February 2024

**O**ur analysts examined the performance of 11 T. Rowe Price Retirement Funds (RFs) to determine the value added for clients by the firm's target date design process and investment implementation, both at the RF level and in the management of the underlying strategies.

## Study universe

The 11 RFs included in the study (Figure 1) were those that had at least 10-year performance histories as of December 31, 2023. Two RFs with relatively distant target dates (2060 and 2065) were excluded from the study because of their incomplete performance track records. The Retirement 2060 Fund inceptioned June 23, 2014, while the Retirement 2065 Fund inceptioned October 13, 2020.

A separate set of target date funds using an alternative T. Rowe Price-designed glide path (the target glide path) also was excluded from the study. (See Figure 2 for a list of these funds and their inception dates.) Additionally, T. Rowe Price's Retirement Blend Funds were excluded from the study. These funds, which invest in an underlying mix of actively managed funds and passively managed index funds, inceptioned on July 26, 2021, and, thus, had limited historical track records. The T. Rowe Price funds included in the study held nearly all (approximately 96%) of the RF assets managed by the firm as of December 31, 2023.

As of December 31, 2023, each RF invested its assets in a portfolio of up to 24 underlying T. Rowe Price funds covering the major global equity and fixed income sectors (Figure 3). Twenty-two of the 24 underlying T. Rowe Price funds were actively managed, while two—a large-cap U.S. stock allocation and a long-term U.S. Treasury allocation—used passive management to replicate the returns for their benchmarks (the S&P 500 Index and the Bloomberg U.S. Long Treasury Bond Index, respectively).

## Performance periods

The performance of each RF in the study was examined across 1-, 3-, 5-, and 10-year rolling periods (rolled monthly) since each

RF's inception through December 31, 2023. Because these inception dates—and, thus, fund longevities—differed, the number of rolling performance periods also varied for each RF. The total rolling periods in each time frame for each RF are shown in Figure 4.

It should be noted that the number of rolling performance periods declined as the time frames were lengthened. The number of rolling 10-year periods was relatively small, especially for RFs with 2050 and 2055 target dates. Accordingly, the performance results shown for 10-year rolling periods for those funds may have relatively limited statistical significance.

Full performance results for each RF over 1-, 3-, 5-, and 10-year rolling periods can be found in Figures 5, 6, and 7.

## Performance metrics

Our analysis used two specific measures to quantify RF performance:

- Active success rates: the percentage of all rolling periods in each time frame (one, three, five, and 10 years) in which an RF either outperformed a specific benchmark or a component of T. Rowe Price's target date process made a positive contribution to RF returns (see Performance Benchmarks). A positive success rate for a fund was defined as achieving a higher return than the relevant benchmark in more than 50% of all periods included in the study.
- Excess returns: the actual margin of relative RF performance (either positive or negative) against its benchmark or the contribution (positive or negative) that a component of the T. Rowe Price target date process made to RF returns, each in basis points. Excess returns for rolling periods of more than one year were annualized. The excess returns shown in the various tables in the study are the average results across all of the rolling time periods in each 1-, 3-, 5-, and 10-year time frame.

## Performance benchmarks

The objective of the study was to quantify the value added by tactical asset allocation and our management of the underlying strategies. Accordingly, active success rates and excess returns were calculated relative to:

- The appropriate vintages in a family of target date indexes created by Standard & Poor's, which reflect "consensus" strategic asset allocations and glide paths for the industry as a whole based on an annual survey of reported portfolio holdings.
- Hypothetical returns for the RFs based solely on their long-term strategic asset allocations and glide paths (in other words, excluding the effects of tactical allocation).
- The appropriate asset class, sector, and/or style benchmarks for the underlying T. Rowe Price funds in the RF portfolios. For each rolling period, the relative performances of the underlying funds were aggregated to determine if they collectively added to or detracted from RF active performance.

<sup>1</sup> Not included: U.S. Treasury Money Fund.

<sup>2</sup> Prior to October 1, 2020, the name of the U.S. Treasury Long-Term Index Fund was the U.S. Treasury Long-Term Fund.

<sup>3</sup> From inception to 2006, our conservative fixed income allocation was a mix of the T. Rowe Price Short-Term Bond Fund and the T. Rowe Price Summit Cash Reserves Fund (renamed the Cash Reserves Fund on August 1, 2016). In 2006, the T. Rowe Price Short-Term Income Fund replaced these two funds. In May 2011, the name and investment objective of the T. Rowe Price Short-Term Income Fund changed to the T. Rowe Price Inflation Focused Bond Fund, which is now known as the T. Rowe Price Limited Duration Inflation Focused Bond Fund.

---

## Tactical asset allocation

For each RF, the actual weights of the underlying funds in the RF were multiplied by their style-specific benchmark returns to generate positioning inclusive of tactical allocation changes. These positions were then subtracted from each underlying fund's fixed strategic asset allocation weights multiplied by the style-specific benchmark returns. The result was the difference between actual positioning, including tactical decisions and implementation, versus strategic asset allocation positioning. This comparison enabled us to isolate the contribution to performance made by tactical allocation decisions.

---

## Security selection

Historical returns, net of fees and other costs, for the underlying T. Rowe Price funds in the Retirement Fund portfolios were measured relative to their specific asset class, sector, or style benchmarks. Two of these underlying funds, the Equity Index 500 Fund and the U.S. Treasury Long-Term Index Fund, are passively managed funds with the investment objectives of tracking the performance of the S&P 500 Index and the Bloomberg U.S. Long Treasury Bond Index, respectively. The other funds are all actively managed investment vehicles.

The indexes used to calculate excess returns in this analysis were the style-appropriate benchmarks used by the T. Rowe Price Asset Allocation Committee to evaluate the performance of the underlying funds in the RF portfolios (see Figure 8). The RF performance numbers shown in our study represent the true after-cost results for investors. Returns were based on reported net asset values and SEC standardized returns for the underlying funds from which management fees and operating expenses were subtracted. In other words, returns for the underlying funds were based on the after-cost performance of the Investor Class up to the inception date of the Z Class (March 16, 2020) and the after-cost performance results since that date of the Z Class for each underlying fund, which is the class invested in by the Retirement Funds.

Excess returns for the underlying funds were aggregated for each rolling period to show the total contribution (positive or negative) made to the performance of each RF by security selection. Active success rates for positive aggregate return contributions (i.e., value added) and average aggregate excess returns (annualized) were calculated for each 1-, 3-, 5-, and 10-year time frame for each RF. Returns on the underlying funds were included in these aggregate performance calculations as of the date of their addition to the RF portfolio (see Figure 3). Those calculations reflected the changing weights for the underlying funds as the RFs moved along their glide paths.

---

## Performance averages

To provide a high-level summary of the effectiveness of T. Rowe Price's target date process, we calculated performance averages for all 11 RFs in the study across all three of the metrics used in our analysis. Average performance over rolling 1-, 3-, 5-, and 10-year periods since RF inception can be found in Figures 9, 10, and 11. To account for the differing inception dates (and, thus, longevities) of each fund, these averages were time weighted—that is, the results were based on the percentage of the total performance periods in each time frame provided by each fund. Weights for each fund in each time frame are shown in Figure 12. Overall, time weighting had relatively little impact on average performance results.

---

## Data sources

Fund and benchmark return data were taken from T. Rowe Price's internal performance database, which is used by the firm to calculate returns for quarterly, semiannual, and annual client reports; marketing materials; and regulatory disclosures. Benchmark returns in the T. Rowe Price database are collected from index managers. All results were based on total returns, including dividends reinvested.

Dynamic Credit	Dynamic Credit Weighted Benchmark <sup>7</sup>

<sup>1</sup> Not included: U.S. Treasury Money Fund.

<sup>2</sup> The indexes shown here are the style-appropriate benchmarks used to calculate the active performance of the firm's target date portfolios. For the International Stock Fund (ISF) and the International Value Equity Fund (IVE), these benchmarks differ from the indexes used by the funds for their own performance reporting. The standard benchmark for the ISF is the MSCI All Country World Index ex USA (Net). The standard benchmark for the IVE is the MSCI EAFE Index (Net).

<sup>3</sup> Effective 1 May 2021, the benchmark for the Dynamic Global Bond Fund changed to ICE BOA ML 3 month T bill index. Prior to this change, the benchmark was the 3 Month Libor in USD.

<sup>4</sup> Prior to October 1, 2020, the name of the U.S. Treasury Long-Term Index Fund was the U.S. Treasury Long-Term Fund.

<sup>5</sup> From inception to 2006, our conservative fixed income allocation was a mix of the T. Rowe Price Short-Term Bond Fund and the T. Rowe Price Summit Cash Reserves Fund (renamed the Cash Reserves Fund on August 1, 2016). In 2006, the T. Rowe Price Short-Term Income Fund replaced these two funds. In May 2011, the name and investment objective of the T. Rowe Price Short-Term Income Fund changed to the T. Rowe Price Inflation Focused Bond Fund, which is now known as the T. Rowe Price Limited Duration Inflation Focused Bond Fund.

<sup>6</sup> Effective May 1, 2011, the benchmark was changed to the Bloomberg U.S. 1–5 Year Treasury TIPS Index. For time periods prior to this date, returns were measured against a linked performance benchmark composed of 100% Citigroup 3-Month Treasury Bill Index.

<sup>7</sup> As of December 31, 2023, the Dynamic Credit Fund's weighted benchmark was comprised of 25% Bloomberg 1-3 Year U.S. Corporate Bond Index, 25% Credit Suisse High Yield Index, 25% J.P. Morgan Emerging Markets Bond Index Global Diversified, and 25% LSTA Performing Loan Index.

#### Important Information

*Call 1-800-225-5132 to request a prospectus or summary prospectus; each includes investment objectives, risks, fees, expenses, and other information you should read and consider carefully before investing.*

The principal value of the Retirement Funds is not guaranteed at any time, including at or after the target date, which is the approximate year an investor plans to retire (assumed to be age 65) and likely stop making new investments in the fund. If an investor plans to retire significantly earlier or later than age 65, the funds may not be an appropriate investment even if the investor is retiring on or near the target date. The funds' allocations among a broad range of underlying T. Rowe Price stock and bond funds will change over time. The funds emphasize potential capital appreciation during the early phases of retirement asset accumulation, balance the need for appreciation with the need for income as retirement approaches, and focus on supporting an income stream over a long-term postretirement withdrawal horizon. The funds are not designed for a lump-sum redemption at the target date and do not guarantee a particular level of income. The funds maintain a substantial allocation to equities both prior to and after the target date, which can result in greater volatility over shorter time horizons.
