

# Strategic Allocation to Bank Loans May Enhance Value

The asset class offers a low duration profile, attractive yields.

February 2022

## KEY INSIGHTS

- Perhaps best known for historically performing well in rising rate environments, floating rate bank loans provide a unique combination of high yield potential and low duration.
- We believe the long-term historical performance of the asset class through a range of rate environments speaks to its durable nature and value as a strategic allocation.
- Collaboration between the firm's Equity and Fixed Income Divisions is crucial to pursuing better outcomes for our clients over time.

Many investors tend to focus on bank loans only when there is a broad consensus about the Federal Reserve raising interest rates in the short term. While loans have historically performed well under those conditions, we believe the asset class can potentially add value as a strategic allocation in various market environments within the economic and interest rate cycles. Loans have provided positive returns in 24 out of the last 25 years (Figure 1).<sup>1</sup> This speaks to the historically durable nature of the asset class. Due to its unique low-duration<sup>2</sup> profile, the loan asset class has generally been negatively correlated with many fixed income alternatives. Therefore, we believe it can act as an effective diversifier in a broader fixed income portfolio.

The current macro environment has led to an increase in intermediate- and long-term Treasury yields. Duration risk is in the foreground with the Fed having pivoted to a more hawkish tone over tapering its asset purchases and signaling upcoming rate hikes to combat persistently high inflation. The floating rate feature of loans—where coupons adjust based on a short-term benchmark rate such as the London Interbank Offered Rate (LIBOR) or the Secured Overnight Financing Rate (SOFR)—gives them a low-duration profile. Therefore, loans may offer some protection from rising interest rates while providing the potential for attractive income (Figure 2).

Head of Global High Yield Team,  
Portfolio Manager of the Floating  
Rate Fund

### Meaningful Income From Bank Loans

Given the current prevalence of higher-quality assets with very low or negative yields, the loan asset class is one of the few fixed income segments where investors should be able to find relatively greater income. In 2020, after the global pandemic stalled new issuance, issuers incentivized investors to reengage in the loan market by offering favorable deal terms, including LIBOR floors—a minimum value imposed on the benchmark component of the floating rate coupon—and new issue discounts to par. Both features helped keep yields in the bank loan market at relatively attractive levels, while today, the yield is enhanced by the near-term prospect of rising short-term interest rates.

Persistently high inflation has led the Fed to signal an increasingly rapid tightening of monetary conditions. Bank loan coupons are poised to reset higher in 2022 as the central bank implements incremental short-term rate increases. We believe that the potential resiliency of loan income in differing rate scenarios contributes to the attractive value of the asset class.

### Relatively Lower-Risk Way to Access Sub-Investment-Grade Credit

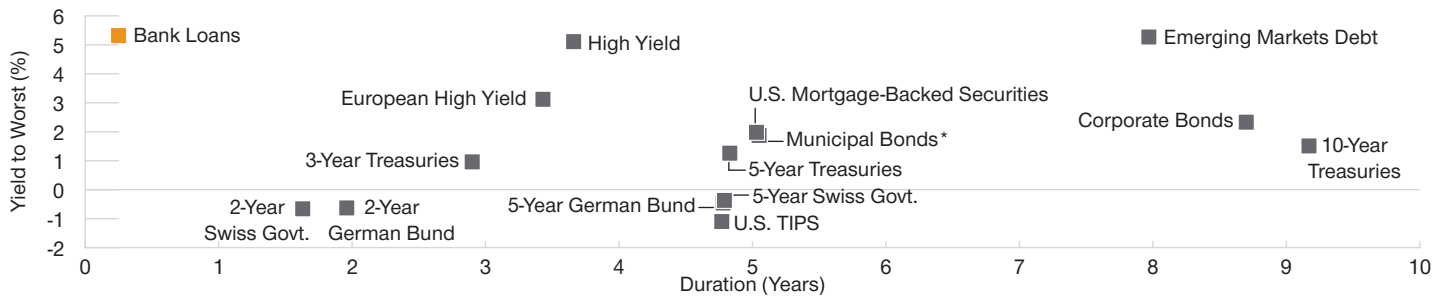

Loans generally have high yield credit ratings but provide a lower-risk way to access the sub-investment-grade credit market relative to high yield bonds. As an asset class, loans have a higher repayment priority than high yield bonds if an issuer defaults. Historically, this has resulted in higher recovery rates in default situations. At the end of 2021, for example, the long-term recovery rate for U.S. high yield bonds was around 40%, compared with roughly 65% for U.S. loans. The default rate was extraordinarily low (near 0%) given loose monetary conditions and improving fundamentals throughout the economic recovery.

Historically, loans have tended to yield less than high yield bonds due to their higher-quality characteristics, but today, the two options have similar yields and credit spreads.<sup>3</sup> Given their shorter-duration profile and seniority in the capital structure, we believe the loan asset class provides investors a more defensive way to add exposure to the below investment-grade market while also providing attractive income.

<sup>3</sup> Credit spreads measure the additional yield that investors demand for holding a bond with credit risk over a similar-maturity, high-quality government security.

## Higher Income With Lower Duration

(Fig. 2) Duration and yield across fixed income sectors

As of December 31, 2021.

**Past performance is not a reliable indicator of future performance.**

Still, bank loans can become illiquid during periods of market stress, and the asset class is subject to credit risk. Therefore, selecting winners and avoiding troubled credits through active management is critical.

### Collaboration May Foster Better Outcomes

Our long-tenured team has significant experience and scale in the bank loan market. T. Rowe Price's sub-investment-grade platform is a single research team covering high yield bonds and bank loans, which allows us to try to capture relative value and inefficiencies across both asset classes. Furthermore, our below investment-grade analysts are part of a much broader research organization. The ability and willingness to share information and insights between the Equity Division and all fixed income teams are crucial in pursuing better outcomes for our clients over time.

For example, collaboration with our equity colleagues recently enabled us to participate in a private credit offering by electric vehicle manufacturer Rivian.<sup>4</sup> Our equity platform was a top shareholder of the company's private equity, which allowed our team to conduct thorough due diligence as we underwrote the private credit. The company's initial public offering in November also provided us with a meaningful cushion from subordinated capital.

Rivian is developing vehicles primarily targeting the attractive truck, sports utility vehicle, and commercial vehicle end market segments. Amazon is an owner and has a large business-to-business contract with Rivian to provide vans, which should help cushion demand volatility and support operating leverage. We have a favorable outlook on the potential for electric vehicles to take market

<sup>4</sup> Rivian represented 0.70% of the Floating Rate Fund as of December 31, 2021.

share broadly, and this investment provided an opportunity to express

that view outside of the syndicated loan universe.

### WHAT WE'RE WATCHING NEXT

The emergence of coronavirus variants that could delay the reopening of the economy from the impact of the pandemic is an important consideration. We are also closely monitoring the potential for robust demand for the asset class to cause a meaningful increase in repricing transactions as well as less favorable deal terms.

**Past performance is not a reliable indicator of future performance.** All investments are subject to market risk, including the possible loss of principal. Investments in floating rate bank loans may at times become difficult to value and highly illiquid; they are subject to credit risk such as nonpayment of principal or interest, and risks of bankruptcy and insolvency. They are subject to prepayment risk (that can reduce the potential for gains). The loans are usually considered speculative and involve a greater risk of default and price decline than higher-rated bonds. Investing in private credit involves greater risk. Risks include potential loss of capital, illiquidity, less available information and difficulty in valuating private companies. Active management does not ensure a favorable outcome, and there is no assurance that any investment objective will be achieved. Diversification does not assure a profit or protect against loss in a declining market. All charts and tables are shown for illustrative purposes only.
