

# A Challenging Environment for Stocks and Bonds

May 2022

## KEY INSIGHTS

- Global stocks and bonds have both declined year-to-date, frustrating investors who typically rely on the diversifying benefits of fixed income allocations.
- We believe that expectations for interest rate hikes have largely been priced in; therefore, the positive correlation between stock and bond performance is, in our view, unlikely to be sustained.

**Tim Murray, CFA**  
*Capital Markets Strategist,  
Multi-Asset Division*

During the first part of 2022, stocks declined sharply due to rising geopolitical uncertainty and accelerated inflation. Notably, bonds—which typically help to manage downside risk in a portfolio—pulled back almost as much as stocks (Fig. 1), frustrating

investors who often rely on the diversifying benefits of fixed income securities during equity market sell-offs.

While stock and bond returns historically tend to have low or negative correlations over the long term, correlations have at

\*Fed rate hike expectations calculated as the difference between the 2-year U.S. Treasury yield and the federal funds rate. Stock and bond correlation is the rolling 2-year correlation of monthly price changes for the S&P 500 Index and U.S. 10-Year Treasury futures. Correlation measures how one asset class, style or individual group may be related to another. A perfect positive correlation means that the correlation coefficient is exactly 1. This implies that as one security moves, either up or down, the other security moves in lockstep, in the same direction. A perfect negative correlation (-1) means that two assets move in opposite directions, while a zero correlation implies no relationship at all.

times been positive over shorter periods. Environments where expectations for central bank tightening are increasing rapidly, in particular, can be challenging for both asset classes (Fig. 2). This is because rising interest rates typically push yields higher and bond prices lower. Meanwhile, stocks usually suffer in a rising rate environment because rate hikes often slow down economic growth, resulting in lower earnings.

Rate hike expectations have increased rapidly in early 2022. At the beginning of the year, markets generally expected the U.S. Federal Reserve to raise rates at a measured pace—despite already elevated inflation—and then pause with rates still at relatively low levels. However, this outlook shifted dramatically in the

first quarter, as inflation concerns were exacerbated by Russia's invasion of Ukraine and a spike in oil prices.

Although a cautious approach is warranted amid growing economic headwinds, we believe that expectations for more hawkish central bank policies have largely been priced into asset valuations. If this view is correct, the strong positive correlation between stock and bond returns seen in early 2022 is unlikely to be sustained. As a result, the Asset Allocation Committee has further increased its allocation to long duration<sup>1</sup> U.S. Treasuries, which the committee believes are more likely to offer portfolio diversification<sup>2</sup> potential now that yields have adjusted higher.

<sup>1</sup> Duration measures a bond or other debt instrument's price sensitivity to a change in interest rates.

<sup>2</sup> Diversification cannot assure a profit or protect against loss in a declining market.

## INVEST WITH CONFIDENCE®

T. Rowe Price focuses on delivering investment management excellence that investors can rely on—now and over the long term. To learn more, please visit [troweprice.com](https://troweprice.com).
